

ASDV 2540, Databases Design Assignment 4

Problem 1: Use Visual Paradigm and create the superclass Employee with its 2 subclasses Secretary and Engineer. Underline the key SSN as you learned in the previous lab. To create the upside down U Create a textbox with no border and then rotate the U clockwise twice (Right click on U > Presentation Options > Rotate Clockwise).

Problem 2: Use Visual Paradigm and generate the EER shown below

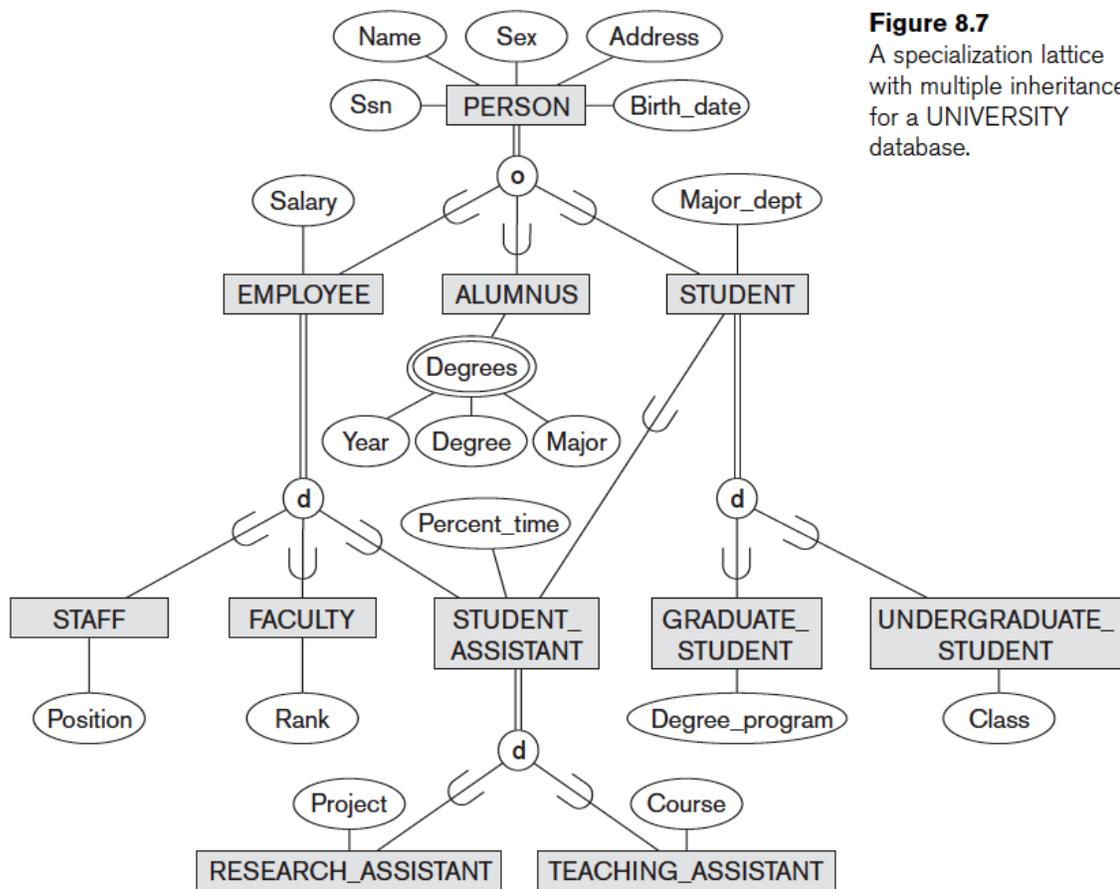

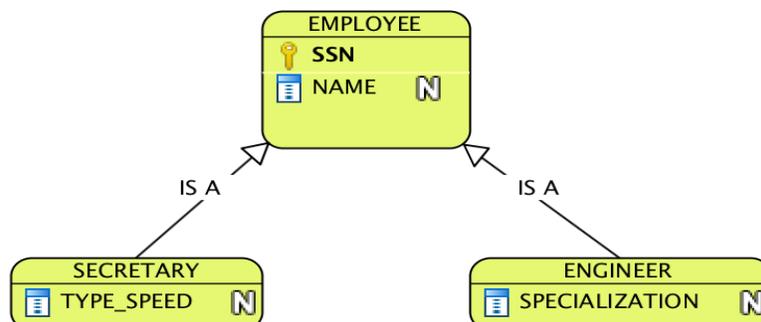

Figure 8.7
A specialization lattice with multiple inheritance for a UNIVERSITY database.

Problem 3

Create New ER model. **SELECT CONCEPTUAL** model not **PHYSICAL**. Drag in 3 Entities. Name them as shown below.

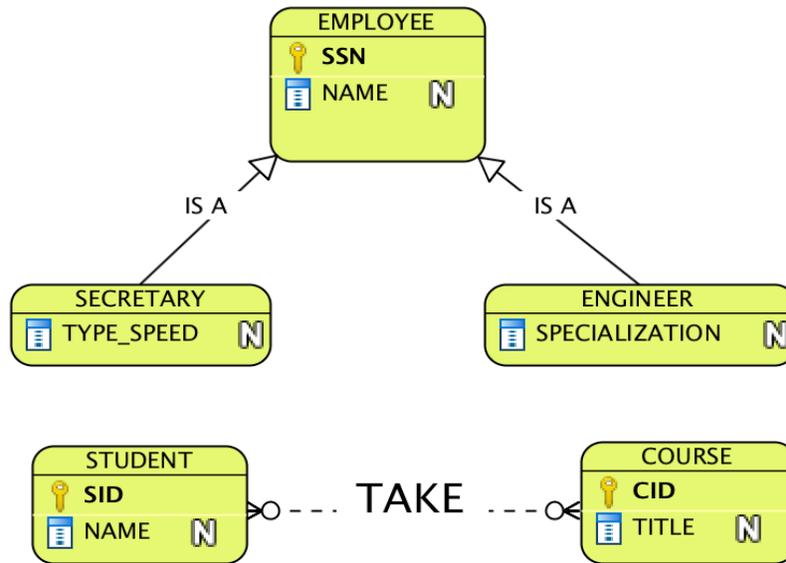

- - To Add attributes - right click on the entity > New Column
- - To set a KEY -right click on the attribute (i.e. SSN) > Include in Primary Key
- - To add IS-A - double click on generalization arrow

Problem 4

Add to your existing ER model

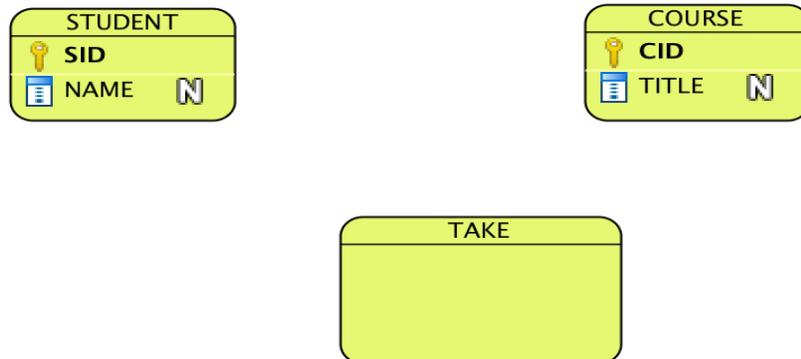

Drag in Entities **STUDENT**, **COURSE**. Name them as shown below. Put a many to many relationship in between called **TAKE**. Name the attributes and set the keys as shown below

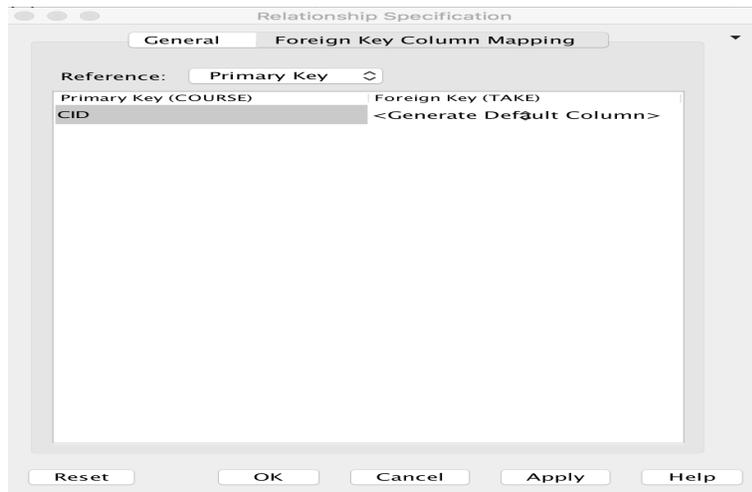

Problem 5

Delete the many to many relationship **TAKE** of **STUDENT COURSE** .

1. Create a new entity **TAKE**.
2. Put in entity **TAKE** the new column **SID**

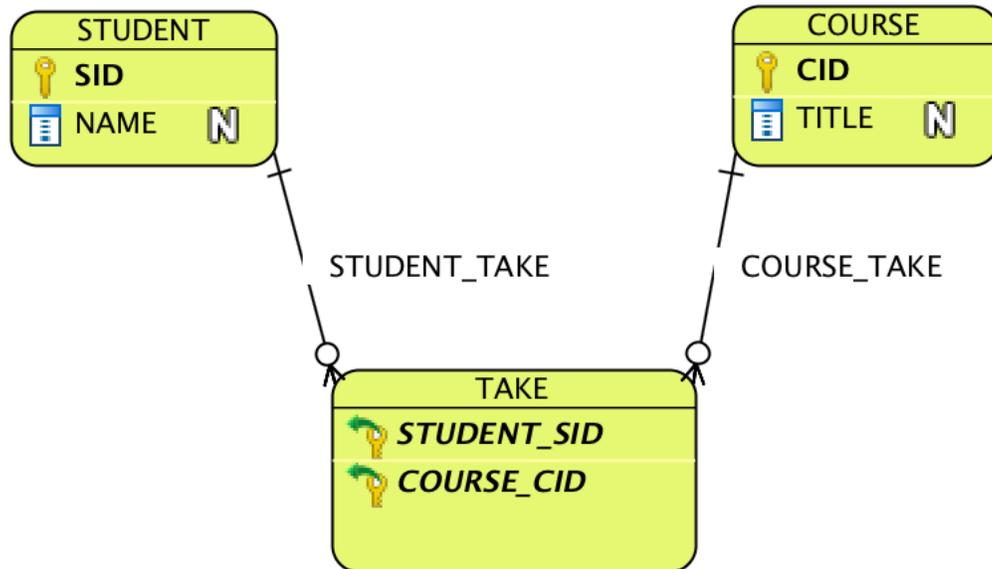

3. Drag a 1-to-many relationship from STUDENT to TAKE. The default column is a SIDSTUDENT which is a foreign key. Rename it to SID.
4. Similar, drag a 1-to-many relationship from COURSE to TAKE. When the following dialog pops up, SELECT CID, click Apply, OK.

5. The final diagram is shown below of breaking the m-to-m into 1-to-m is shown Below.

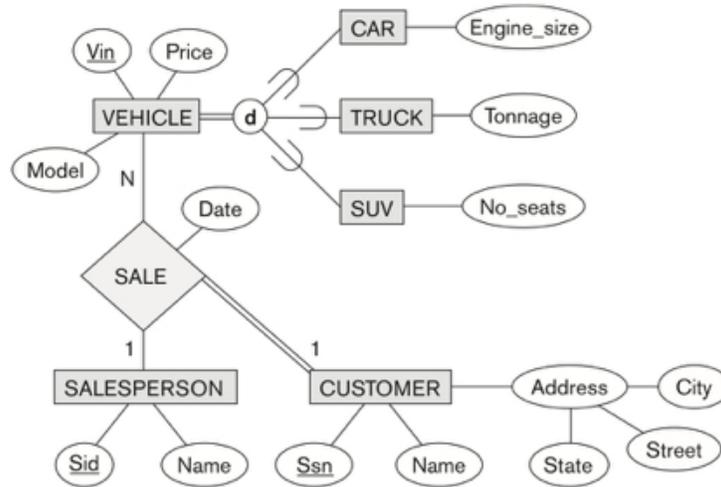

YOU CAN SEE STUDENT_SID is an FK in ENTITY TAKE from the GREEN arrow that flows outside the key diagram.

WE WILL USE THIS AS OUR RELATIONAL SCHEMA.

Problem 6

Use Visual Paradigm and map this schema into a **RELATIONAL SCHEMA** as in problem 5.

Problem 7

Use Visual Paradigm and map this schema into a **RELATIONAL SCHEMA** as in problem 5.
